Webmin and Virtualmin on a VPS: a server admin tool and a hosting panel, explained

 VPS & Servers  Created on **October 16, 2026**  Updated on **October 18, 2026**  4 min read

This article is for people with a VPS or a dedicated server with root access. On shared plans the panel is cPanel, and you neither choose nor install another one. **The short answer:** **Webmin** and **Virtualmin** get mixed up, but they do different things. Webmin is a **browser interface for administering the system**: users, services, packages, firewall, scheduled tasks and each program’s configuration files. Virtualmin is a **hosting panel** that runs on top of Webmin and creates “virtual servers”: a domain with its own folder, site, mail, DNS zone and databases. Both are open source; Virtualmin also has a paid edition.

Which is which

Tool	What it is for
Webmin	Running the server without memorising commands: checking services, editing configuration, managing packages and users. It does not create hosting accounts: it is a panel for the administrator.
Virtualmin	Managing several sites and clients: each domain becomes a virtual server with site, mail, DNS and databases. It installs and configures the web stack for you.
Usermin	The end-user side: mail in the browser, password, the files in their account. Useful when clients should not see Webmin.
Free or paid Virtualmin	The free edition is enough for many servers. The paid one adds features and vendor support; compare on the official Virtualmin page.
Webmin on a server that already has another panel	A bad idea: two programs writing to the same configuration files. Use one or the other.

➞ Getting started without opening a dangerous port

1 Decide which one you need. Only want help running a server with one site? Webmin. Hosting several domains with mail? Virtualmin, which brings Webmin with it.

2 For Virtualmin, start on a freshly installed system and a supported release (the list is in the official Virtualmin documentation). The official install script configures the whole stack and is not meant for servers that are already set up.

3 Log in with a system user. Webmin accepts root or a user with sudo. Prefer the latter: **creating a user with sudo**.

4 Close the port to the internet. Webmin listens on port 10000 by default. Open it to your own address only: `sudo ufw allow from YOUR.IP to any port 10000 proto tcp`
`sudo ufw status`

5 Turn on two-factor authentication in Webmin's settings and keep the package updated with the rest of the system: **updating a Debian or Ubuntu VPS**.

6 Check the service is running and, with Virtualmin, ask it to check its own configuration: `sudo systemctl status webmin`
`sudo virtualmin check-config`

Webmin is a door to root in the browser.

Whoever gets into Webmin controls the whole server. Port 10000 open to the world, with a weak password or an old version, is an invitation. Firewall, a strong password, two-factor and updates are not optional.

Use it to learn, too.

Webmin shows the configuration files you are changing. Seeing what each button writes is a good way to understand the server before moving to the command line.

NEED A HAND?

Not sure whether your VPS needs Webmin, Virtualmin or neither? Tell us what will run on it.

In our plans

Our VPS plans give you full access over SSH, on KVM virtualisation, so the machine is yours to administer and you decide what to install on it, Webmin included. The sizes run from VPS1 (1 vCPU, 2 GB RAM, 40 GB NVMe) up to VPS6 (32 vCPU, 64 GB RAM, 1,280 GB NVMe). Cloud plans also run from Cloud1 (1 vCPU, 2 GB RAM, 25 GB) to Cloud6 (32 vCPU, 64 GB RAM, 400 GB). Remember that a panel such as Virtualmin runs next to your sites and mail on the same machine, so take the RAM into account when you choose the size. Not sure which fits? Tell us what will run on it.
