# 429 rate_limited in a coding tool: why agents reach the limit and what to do

Choosing a Tool & Fixing Errors Created on **November 28, 2026** 2 min read

`429` with the code `rate_limited` means you went over the limit of requests per minute. It is not a lack of credits or points, and it clears when the minute ends. Coding agents get there faster than an ordinary program, because they make many requests in a row.

## The limits

| Who is asking | Limit |
|---|---|
| **Each key** | 90 requests per minute |
| **The whole account, adding up its keys** | 300 requests per minute |

Reseller accounts get 300 per key and 1,000 for the account. These are today's values and they can change: the request at the end of this page shows yours.

## Why agents get there

1. Each tool round is a new request: read a file, edit another, run a command, and back to the model. See **why a coding model uses tools**.

2. Claude Code also uses the background task model ( `ANTHROPIC_DEFAULT_HAIKU_MODEL` ) and asks for a token count to manage the context. The count costs nothing, but it is a request like any other.

3. Two windows, two agents or one agent with sub-agents, on the same key, share the same 90 requests.

## What to do

1. Wait the number of seconds in `Retry-After`. The tools usually retry on their own: Claude Code retries failed requests up to 10 times by default (`CLAUDE_CODE_MAX_RETRIES`) and Codex up to 4 (`request_max_retries`, in the provider in `config.toml`).
2. Do not run several sessions at once on the same key. If you need several, give each tool its own key: each one has its 90 requests, within the account's 300.
3. See how many requests are left with the request below. It spends no credits.
4. If your work needs more, **open a support ticket**: our team can give an account its own limits.

On Linux and macOS:

```
curl "https://api.mozout.co.mz/v1/limits" -H "Authorization: Bearer $MOZOUT_API_KEY"
```

In Windows PowerShell:

```
curl.exe "https://api.mozout.co.mz/v1/limits" -H "Authorization: Bearer $env:MOZOUT_API_KEY"
```

The answer has `requests.limit`, `requests.remaining` and `requests.reset` (the end of the minute, in Unix seconds). The same numbers come in the `X-RateLimit-Limit`, `X-RateLimit-Remaining` and `X-RateLimit-Reset` headers of every answer. In Claude Code the error arrives as `rate_limit_error`; in Codex, with the `code` `rate_limited`.

## Not to be confused with plan_limit_reached

There is another `429`, with the code `plan_limit_reached`: the Coding Plan points ran out and the request cannot be paid with credits. Waiting a few seconds does not help. Wait for `resets_at`, turn on Use credits when the plan runs out in the **Plan tab of All in One AI** or buy credits. The points are explained in **Coding Plan: which plan to choose**.
